

Bi-Directional PLC - SQL Server Gateway Windows Service

The PLCq1 is a Windows service that can reside on a SQL Server machine or on an independent physical or virtual machine. It transfers data between a Sequel Server database and PLC memory locations called registers using modified SQL commands to transfer the data.

The program comes with an Easy-To-Use Editor which allows you to input your command parameters and directs the PLCq1 service to transfer data between the PLC and the SQL Server.

So say goodbye to complicated proprietary protocols and simplify your input process and report generation with PLCq1 from Diversified Engineering Concepts.

DEC... easily empowering you by putting data control into your hands!

Pricing:

Each distribution pack includes software to connect your SQL Server to (5) PLC driven devices. Each device will require a client access license which are sold in blocks of (5) CALs. There is also a one-time installation fee.

Price of Installation & 5 CALs: Contact Us For Pricing.
